DUDLEY ROAD EAST - OLDBURY – WEST MIDLANDS – B69 3EB

Marwel Conveyors design and manufacture 90 degree side transfer mechanisms for a wide variety of product types.

They all have the advantage of a rugged and reliable design.

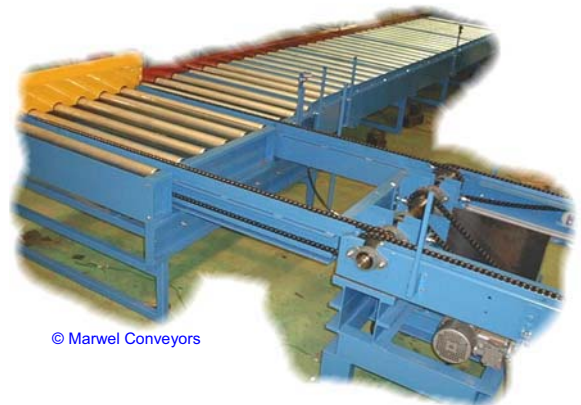

Typical are those used for moving pallets between conveyors.

These can use either pneumatic or hydraulic lift cylinders depending upon the load or they can be fully motorized.

The motorized units enable faster transfers without the need for an air supply to be provided.

As can be seen from the photographs the units are heavily constructed for a long and trouble free life.

The transfer can be made using rollers, chains or belts.
Marwel will advise on the best type of transfer to be used for a given load type.

Additional stops can be incorporated if more accurate transfers are required.

The junctions can either be in a T shape, 90 degree transfer, or if required a cross junction can be provided.
