Marwel design and manufacture special purpose trolleys used in a wide variety of industries.

Above is a typical example of a large pedestrian controlled platform truck. The truck was fitted with a series of belt conveyors to transfer long product length sideways on and off the truck. The truck can be steered from both ends and can move both lengthways and sideways.

Another example of Marwel powered trolleys is the high speed shuttle cars widely used throughout industry. The example below runs on floor guide rails between dedicated stations. They are often automatically positioned using laser measurement. Data transfer to the truck is by a two way infra-red communication system.

Marwel automatic trucks are used for loading and unloading overhead conveyors.

The picture on the right shows a truck handling flight-bars in a paint system.

The truck shown on the left was used to automatically load and unload robot welding cells. It had a telescopic top frame that could move completely off the truck, to both sides and into the robot cell.
