FLOOR TOW CONVEYORS

Floor Tow Conveyors systems generally consist of a fixed floor conveyor either, above or below floor level, driving a series of platforms or cars or trolleys around a fixed circuit.

The platforms are fixed to the tow chain whereas the cars and trolleys are self-supporting and can be detached from the floor conveyor by an operator or automatically.

The conveyor is usually of the chain type, either linear or bi-planar driven by an electric motor. However Marwel have also supplied this type of conveyor driven by means of pull rods and hydraulic cylinders.

Marshall Welded Steel Ltd have the ability to design, manufacture and install all of these types of specialist conveyor systems.
