DUDLEY ROAD EAST - OLDBURY – WEST MIDLANDS – B69 3EB

Transporters are widely used in the finishing industry for moving components between process tanks.

However, transporters are also very useful in handling difficult components in other industries.

Transporters can be fitted with special grabs to handle the components directly or in groups of components. A typical example is shown in the photograph opposite.

The grab shown can pick components in groups of 4 from a horizontal position (e.g. floor conveyor) and place them in a vertical position (e.g. overhead conveyor).

In process plant operations the components are normally supported on jigs that hang from a flight bar.

Single transporters are generally used for systems with long cycle times. When shorter cycle times are required multiple transporters are used.

All Marwel transporter systems have PLC or computer control for both manual and automatic operation.
