DUDLEY ROAD EAST - OLDBURY – WEST MIDLANDS – B69 3EB

Transporters are widely used in the finishing industry for moving components between process tanks.

However, transporters are also very useful in handling difficult components in other industries. Single transporters are generally used for systems with long process times, whereas multiple transporters are used for systems requiring high outputs. The transporters can be fitted with special grabs to handle the components directly, or where a variety of components need to be handled, the transporter can handle a standard flight bar, from which the components are supported.

Transporters generally interface with other conveyor systems such as overhead conveyors or floor conveyors.

Marwel control systems usually incorporate PLC or computer control for the fully automatic and manual operation. All the usual safety interlocks are built into the system such that reliable and safe operation can be guaranteed.
