Belt Conveyors come in a wide variety of types, shapes and sizes. Marwel Conveyors has developed 2 types of belt conveyor specifically designed to handle kayaks and rafts.

The first type of conveyor is based on a perforated modular plastic belt. They can be supplied in a wide range of widths & colours.

There are some significant advantages:-

Positive Drive – sprocket driven

Positive Tracking – belt side guides

Wide Temperature Range – 40° to +90°

Strong and Robust

Low tension system – low maintenance

Easy to Repair – no specialised equipment needed

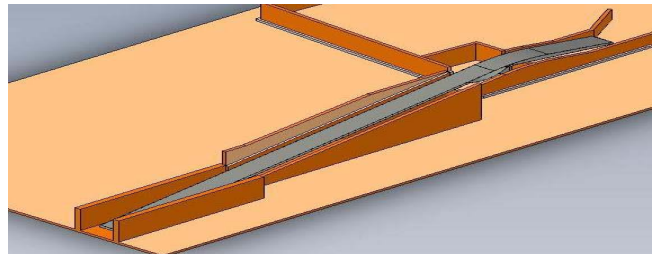

Reduced spares inventory

Low power consumption – less emissions

Homogenous belt properties (no splice)

High levels of permeability with no loss of strength

High grip and non skid surfaces available in any combination

The second type is based on a rubber belt with a special surface we have called “boat grip”. This unique belt surface gives a high coefficient of friction. It is especially effective when operating under wet conditions against the advanced materials used in the construction of modern kayaks. These conveyors are available up to 2.1 metres wide.

Marwel Conveyors are aware of the need to work closely with the Customer to select the correct type of conveyor for the application. Then to work in detail, at an early stage, with their civil engineers and builders, prepare detailed drawings and ensure a smooth and trouble free installation.
